
Cybersecurity Self-Check

Most breaches at small businesses start with ordinary gaps, not sophisticated attackers. Run through this in five minutes to see where you actually stand.

7 WARNING SIGNS TO CHECK RIGHT NOW

- ☐ **Shared logins.** A shared inbox, admin password, or social account passed around between people.
 - ☐ **No offboarding process.** When someone leaves, is access revoked the same day — or does it just sit there?
 - ☐ **Outdated software.** Old plugins, unpatched servers, point-of-sale systems nobody's updated in a year.
 - ☐ **Untested backups.** Having backups isn't the same as knowing they actually restore.
 - ☐ **Personal devices, no separation.** Personal phones and laptops with access to business email, Slack, or accounting systems.
 - ☐ **No multi-factor authentication.** MFA missing on email, banking, or admin accounts — the single highest-leverage gap to close.
 - ☐ **Nobody owns security.** Not "everyone's responsible" — an actual named person who owns the decisions.
-

WHAT AN AUDIT ACTUALLY CHECKS

- ☐ Who has access to what, and whether it still makes sense
 - ☐ Where sensitive data lives and how well it's protected
 - ☐ What's outdated, unpatched, or unsupported
 - ☐ Whether backups actually restore, not just exist
 - ☐ What happens, step by step, if one account is compromised today
-

Scoring yourself

Checked **0-1** boxes: solid baseline, worth a light review. **2-3**: real gaps worth closing soon. **4+**: an audit isn't optional anymore — it's overdue.
